

Mosquito Control

Controlling mosquito and midge larvae in your lakes and ponds is one of the most effective methods in managing these pesky and dangerous insect populations.

BIOLOGICAL CONTROL

Aquagenix utilizes biological controls and various EPA-approved larvicides that are safe for use in the water. When performed on a regular basis, these treatments have shown to be very effective in reducing mosquitoes and midges in homeowner areas.

An important thing you can do as a property owner is to eliminate all other sources for mosquito breeding, and understanding mosquito's growth happens in any standing water is crucial. Having water features that provide aeration is also very helpful in reducing mosquito problems.

PEST MANAGEMENT

Our most recommended biological control and most widely used fish in the world for mosquito control is the *Gambusia* fish (commonly known as Mosquitofish), a native and natural predator of mosquitoes and midges. Mosquitofish live approximately 2 years and can tolerate a wide variety of temperatures. These minnow-sized fish are voracious eaters of mosquito and midge larvae, and when you consider they will continue to reproduce all year with females producing multiple broods, they are an excellent choice for control.

There are numerous products available to apply for mosquito control, and a variety of application types ranging from granular pellets to liquid. This is why having a custom Pest Management Program is very important to be able to control the various stages of mosquito growth.
